TECHNIQUES INTRODUCED

Contact · Indicator · ESP Strike · Induced Methods · Ascension & Descension · Jigging · Swing · Retrieve

"I helped develop long rods for nymphing back in the early 1990s. The reach, the mend control, the sighter sensitivity — a 10.5 or 11-foot rod in the right hands changes everything about how you can present a nymph in complex currents."

Instructor note: eight technique pillars cannot all be mastered in one day. Prioritize contact/tight-line with tuck cast, ESP strike discipline, and water reading by energy economy — these are the highest-return skills. Induced methods and jigging are introduced with one practice attempt each. Full depth comes from the 2-day program.

Quick Reference

EIGHT TECHNIQUE PILLARS

TECHNIQUE	EXECUTION & BEST USE
CONTACT / TIGHT-LINE	Upstream tuck cast, high rod, sighter tracking — most sensitive for close-range complex water.
INDICATOR SUSPENSION	Yarn, airlock, or dry fly suspends weight — best for distance (25+ ft) and slow flat water.
ESP STRIKE	Set on any sighter deviation, any hesitation. Set at end of every drift. Never hesitate.
INDUCED — ASCENSION	Check rod during drift — current pushes fly upward naturally — mimics emerging nymph.
INDUCED — DESCENSION	Lower rod during drift — fly sinks deeper into the cushion — reaches reluctant deep holders.
LEISENRING LIFT	Cast upstream, track to fish, check rod 4 ft above target — fly rises into fish's face.
JIGGING	Rod-tip oscillation on tight line — vertical bounce through strike zone — jig hook rides point-up.
SWING / SWYMPHING	Dead drift transitioning into downstream swing — emerger imitation on the rise — hatch trigger.

LEADER CONFIGURATIONS

CONFIGURATION	BUILD & BEST USE
STANDARD INDICATOR RIG	Tapered leader 9–12 ft, 4X–6X tippet, indicator at 1.5x water depth. Best for distance and big water.
EURO / MONO RIG	20–30 ft of mono — no fly line — sighter + tippet ring + fluorocarbon tippet. Maximum contact and sensitivity.
CZECH LEADER	10–14 ft, 20 lb butt, colored sighter section, two flies on dropper loops. Close-range pocket water.

MODULAR LEADER	Tippet ring allows rapid switch between euro, indicator, dry-dropper. One leader serves all techniques.
SIGHTER MATERIAL	Amnesia mono or bi-color indicator mono — your visual strike detection without surface indicator.
TIPPET RING	1–1.5 mm micro ring at sighter-tippet junction — allows rapid tippet changes without rebuilding leader.

TECHNIQUE BY WATER TYPE

WATER TYPE	RECOMMENDED TECHNIQUE
FAST POCKET WATER	Contact / tight-line with tuck cast. High rod. Two jig nymphs. Short casts. One seam per drift.
RIFFLE SEAMS	Contact or Czech style. Heavier anchor fly. Sighter at 45° angle. Expect subtle takes.
RUN TAILOUTS	Indicator or contact. Dead drift → swing at end. Prime for ESP set at the turn.
SLOW FLAT POOLS	Indicator (smallest that supports weight) at distance. Drag-free drift. Subtle yarn indicator.
IDENTIFIED FISH	Leisenring Lift. Cast upstream, track, check rod 4 ft above — precision induced take.
HATCH-ACTIVE WATER	Swing or swymphing. Nymphs rising on the swing = perfect emerger imitation. Aggressive takes.

ESP STRIKE RULES

RULE	DETAIL
WHAT TRIGGERS THE SET	Any sighter deviation: twitch, hesitation, jump, straightening, upstream tick — set immediately.
END-OF-DRIFT SET	Every drift ends with a hook set into the back cast. You will catch fish you never felt take.
FLASH OF A TROUT	See a fish tilt, turn, or flash white mouth in the water — set before it touches the hook.
THE HESITATION HABIT	The gap between 'I think I saw something' and 'set!' costs more fish than any other single habit.
WILD TROUT HOLD-TIME	Wild trout reject a nymph in under 1 second. Contact-to-set timing is everything.
CONVICTION RULE	If you're not sure, you're sure enough. Err toward setting. Never toward hesitation.

WEIGHT CALIBRATION — FINDING THE STRIKE ZONE

#	SIGNAL	ACTION
1	NO TICKS AT ALL	Too light. Add weight (split shot or heavier fly) until you feel bottom.
2	OCCASIONAL TICK	Target zone. Fly is in the cushion 6–18" off bottom. This is correct.
3	CONSTANT TICKING	Too heavy. Remove weight until occasional tick resumes.
4	CONSTANT SNAGS	Way too heavy or wrong seam. Reposition and reduce weight.

1-Day Intensive — Art of the Nymph

7:30 – 8:00 am **Philosophy, energy economy & gear orientation** **PHILOSOPHY + GEAR**

LEARNING OBJECTIVES

- Understand the energy economy principle and its application to locating prime lies
- Appreciate Mac's long rod development history and why it matters for contact nymphing
- Build a functional Euro/mono rig or indicator rig before going to water

- Establish ESP strike discipline as the primary mindset for the day

KEY CONCEPTS

Energy economy: food + comfort + protection — trout are exactly where physics places them · Strike zone: 6–18" off bottom in slower current — calibrate to this all day · Long rod (10–11 ft): better reach, sighter control, tippet protection — developed in the early 1990s · Tuck cast foundation: high stop, vertical entry, fast sink, natural slack · ESP: any sighter deviation = set. End of every drift = set. Never hesitate.

ACTIVITIES

- Abbreviated leader build: Euro/mono rig or indicator rig depending on group skill level
- Water feature ID: 5 lies on the stream map — students call the energy economy score for each

MAC

"I helped develop long rods for nymphing back in the early 1990s. The reach, the sighter sensitivity, the mend control — a 10.5 or 11-foot rod in the right hands changes everything."

Checkpoint: Each student's leader is built and functioning before going to the river.

8:00 – 8:15 am

Walk to water

8:15 – 9:45 am

Reading water & contact / tight-line nymphing

WATER + CONTACT

LEARNING OBJECTIVES

- Apply energy economy to identify prime feeding lies in each water type encountered
- Execute the tuck cast and maintain sighter contact through a complete drift
- Practice the one-seam discipline — single most important contact nymphing concept
- Begin applying ESP strike habit on every sighter deviation

KEY CONCEPTS

Energy economy: resting lie vs. feeding lie — identify both before casting · Tuck cast: high stop, vertical fly entry, fast sink, natural slack for contact · High rod: eliminates line on water — direct sighter-to-fly connection · Sighter reading: any twitch, hesitation, jump, or straightening = set immediately · One seam (Humphreys): both flies stay in the same current seam throughout — the foundation of tight-line nymphing · Weight calibration: occasional tick = correct — constant tick = too heavy

ACTIVITIES

- Water walk: identify 3 prime lies with energy economy logic before first cast
- Tuck cast drill: 15 repetitions — instructor confirms vertical entry and sink rate
- One-seam discipline: run 3 drifts in single seam — partner watches for seam crossings
- ESP drill: partner creates sighter deviations — student sets within 1 second

MAC

"George Harvey and Joe Humphreys pioneered this before anyone called it euro nymphing. The tuck cast, the high rod, the one-seam discipline — American innovations. The long rod made all of it more accessible and more sensitive."

Checkpoint: Each student achieves a 10-second sighter-controlled drift in a single seam using tuck cast.

9:45 – 10:30 am

Indicator nymphing — depth control & when to choose

INDICATOR

LEARNING OBJECTIVES

- Set indicator depth correctly using the 1.5x rule
- Execute a mend on indicator rig without dragging the indicator
- Articulate when indicator wins over tight-line for the water in front of you

KEY CONCEPTS

Indicator at 1.5x water depth — tick bottom, back off 4" — that is the correct depth · Size: smallest that supports fly weight — bigger indicator = more drag · Upstream mend: keep indicator and fly in same seam — don't drag across current lanes ·

When indicator wins: 25+ ft distance, slow flat water, big water requiring depth · Strike: any deviation from downstream drift — up, across, hesitation, pause — set

ACTIVITIES

- Depth-setting drill: adjust indicator until nymph ticks bottom, back off to perfect drift
- Indicator vs. tight-line: fish same piece of water with both — student calls which was more effective and why

Checkpoint: Each student correctly sets indicator depth and achieves a drag-free drift at 20+ feet.

10:30 – 11:15 am

Lunch — students observe assigned water and assign techniques before eating

11:15 am – 12:15 pm **ESP strike & induced methods — ascension, descension & the Lift** **ESP + INDUCED**

LEARNING OBJECTIVES

- Apply ESP strike discipline — set on any sighter deviation, end of every drift
- Execute the ascension tactic with rod-angle management, not rod lifting
- Execute one Leisenring Lift at an identified holding position
- Understand when induced beats dead drift and recognize the behavioral cues

KEY CONCEPTS

ESP: any sighter twitch, hesitation, or jump = set. End of drift = set. Conviction rule: if unsure, set. · Ascension: check rod — current pushes fly up — no rod lifting — the current does the work · Descension: lower rod during drift — fly sinks deeper — reach deep holders · Leisenring Lift: cast upstream, track, check rod 4 ft above target — fly rises into fish's face · When induced: fish porpoising, dorsal-then-tail rise forms, caddis activity, lock-jawed dead-drift refusals

ACTIVITIES

- End-of-drift set habit: 10 consecutive drifts all ending in hook sets — build automaticity
- Ascension drill: check rod at identified spot — watch for take as fly rises
- Leisenring Lift attempt: one visible holding fish — cast-track-check sequence

MAC

"The ESP strike is the single biggest leap in a nymph's development. You have to train yourself to set before you're sure."

Checkpoint: Each student demonstrates automatic end-of-drift set and completes one Leisenring Lift attempt at a visible holding position.

12:15 – 1:15 pm **Jigging & swymphing — active nymphing methods introduction** **ACTIVE METHODS**

LEARNING OBJECTIVES

- Execute a jigging motion without creating drag
- Complete a swymphing sequence — dead drift transitioning to downstream swing
- Know when to abandon the dead drift and add movement

KEY CONCEPTS

Jigging: rod-tip oscillation — vertical bounce 3–6" — jig hook point-up reduces snags · Nymph swing: quartering upstream cast, mend to sink, dead drift into natural swing · Swymphing: long cast, upstream mend, dead drift through head, swing the tail as water shallows · When to add movement: boiling subsurface fish, caddis hatch, multiple dead-drift refusals

ACTIVITIES

- Jigging drill: partner confirms oscillation not drag — 10 repetitions
- Swymphing run: long cast into pool head, dead drift, transition to swing at pool tail — feel the take

Checkpoint: Each student completes one swymphing sequence. Instructor confirms the dead drift and swing were distinct phases.

LEARNING OBJECTIVES

- Self-select the correct technique for each section of assigned water without prompting
- Apply ESP strike discipline throughout without instructor coaching
- Diagnose one refusal and adjust technique or depth before changing the fly

ACTIVITIES

- Independent 45-minute session: student covers assigned water using techniques learned today
- Instructor observes from distance — no real-time coaching
- Self-report at end: sections fished, methods used, takes detected or missed, adjustments made

MAC

“The art is reading the water first, then selecting the tool. The complete nymph has multiple moves and chooses based on what the water and fish demand.”

Checkpoint: Student completes the run and debriefs: which technique per section, why, and what the takes or misses felt or looked like.

LEARNING OBJECTIVES

- Receive individual written feedback
- Identify one technical and one water-reading priority
- Build a 30-day nymphing practice plan

ACTIVITIES

- Written instructor assessment: leader build, tuck cast, sighter reading, ESP habit, induced timing, technique selection
- Individual feedback: one strength, one priority, one habit to build on every outing
- 30-day plan: one technique per outing, ESP set journal — count missed vs. detected sets

Checkpoint: Completed assessment returned to each student.
